                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The cDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence located adjacent to polyA region. Also described are: (1) an antibody pecifically for the protein encoded by any of the genes; (2) oligonuclectides obtained from the CDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophages, differentiated from human monocytes by granulocyte-macrophage colony-stimulating factor, the CDNA of each gene has a fully defined sequence, given in the specification, lacking the base sequence CATG located most closely to the poly A region, (4) an antibody specifically for the protein encoded by any of the genes of (3); and (5) oligonucleotides obtained from the CDNA sequences of (3). The genes and cDNAS, are used for the study of gene specificatly and disease onset mechanism e.g. oncogenesis, genetic specifically claimed oligonucleotide tag sequences for human genes
                                                                                                                                                                                                                                                                                                                                                                                                                ó
                                                                                Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.

The present invention describes 100 human genes, which are expressed most frequently in human monocytes. The cDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence located adjacent to polyA region. Also described are: (1) an antibody continuation of the polyA region. Also described are: (1) an antibody specifically for the protein encoded by any of the genes; (2) oligonucleotides obtained from the cDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophages, differentiated from human monocytes by granulocyte-macrophage colony-stimulating factor, the cDNA of each gene has a fully defined sequence, given in the cspecification, lacking the base sequence CATG located most closely to the specification, lacking the base sequence CATG located most closely to the poly A region; (4) an antibody specifically for the protein encoded by any of the genes of (3). The genes and cDNABA, are used for the study of gene specificity and disease onset mechanism e.g. oncogenesis, genetic diseases, drug development and diagnosis. AAAS6107 to AAAS6886 represent specifically claimed oligonucleotide tag sequences for human genes constructions and macrophages
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes 100 human genes, which are expressed most
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genes most frequently expressed in human monocytes and GM-macrophages and M-macrophages studied and with cDNAs characterized, for study of gene specificity, disease onset mechanism, drug development and diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

frequently in human monocytes. The cDNA of each gene has a sequence fully defined in the specification, and lacking the CATG sequence located adjacent to polyA region. Also described are: (1) an antibody specifically for the protein encoded by any of the genes; (2) oligonucleotides obtained from the cDNA sequences; (3) 380 human genes which are expressed most frequently in human macrophages, differentiated from human monocytes by granulocyte-macrophages colony-stimularing factor, the cDNA of each gene has a fully defined sequence, given in the specification, lacking the base sequence CATG located most closely to the poly A region, (4) and natibody specifically for the protein encoded by any of the genes of (3); and (5) oligonucleotides obtained from the cDNA sequences of (3). The genes and cDNAB, are used for the study of gene specificity and disease onset mechanism e.g. oncogenesis, genetic specifically claimed oligonucleotide tag sequences for human genes conservations and macrophages
                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a pharmaceutical composition, comprising at least one agent (1) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

```
CC (I) is an adenosine A2a receptor agonist (Ia), or an oligonucleotide (Ib), containing less than 154 adenosine (A), that is antisense to target genes or corresponding RNA, to genomic flanking regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity or A2a antagonist activity (or at least no agonist activity or A2a antagonist activity (or at cleast no agonist activity or A2a antagonism activity or at this receptor). (I) may be a mixture of (Ia) and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine creeptor-mediated cardiac, lung and/or renal damage or failure compositions are used to prevent, alleviate and/or release and/or receptor-mediated activity or a secondary of this or a denosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome confunction of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome confunction agonism to the composition of the present invention. AAA02719, AAA02719, AAA02721 and AAA02721 to AAA02719. AAA02719, AAA02719

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ઠે
                                             The present invention describes a pharmaceutical composition, comprising at least one agent (I) that prevents, alleviates and/or inhibits adenosine-mediated cardiopulmonary and/or renal damage and/or failure.

(I) is an adenosine A2a receptor agonist (Ia), or an oligomuclectide composition and acceptor agonist (Ia), or an oligomuclectide composition and coding and non-coding regions (i.e. 5' or 3' ends or segments between coding and non-coding sequences), or to all segments of mRNA encoding the adenosine A1, A2a, A2b or A3 receptors, and has A1, A2b or A3 agonist activity or A2a antagonist activity (or at least no agonist activity at this receptor). (I) may be a mixture of (Ia) and (Ib), and optionally also contains one or more surfactants. The compositions are used to prevent, alleviate and/or treat adenosine compositions are used to prevent, alleviate and/or treat adenosine (particularly where associated with ischaemia, toxin release and/or administration of drugs or imaging agents, e.g. adenosine for treating supraventricular tachycardia); (adult) respiratory distress syndrome (e.g. associated with sepsis); (adult) respiratory distress syndrome (e.g. associated with sepsis); (adult) respiratory distress syndrome con surraventricular pachycardia); (adult) respiratory distress syndrome con stress-test agents, particularly where such conditions are associated with acute inflammation. AAA02119, AAA02721 and AAA02721 and AAA02721 and AAA03715 represent specifically claimed phosphorothicate antisense ollowed the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAA02718, AAA02720, AAA02722 and AAA03716 to AAA03720 represent other phosphorothioate oligonucleotides used in the exemplification of the

Sequences AA279710-Z79916 represent SAGE (serial analysis of gene expression) tags used to identify mRNA transcripts which are expression) tags used to identify mRNA transcripts which are differentially expressed in a variety of normal or malignant cell types. Some of the transcripts correspond to known genes or BSTS (expressed configuration or the preferentially or differentially expressed in that particular cell type, while other transcripts correspond to novel genes. The invention also provides a nucleotide comprising a promocer sequence derived from one of the configuration nucleotide sequence, and gene delivery vehicles and host coll ferentially expressed genes, which may optionally be operably linked to a foreign nucleotide sequence, and gene delivery vehicles and host comprising the polymucleotides of the invention. A nucleotide comprising sequences AAZ79710-Z79916 may be used in diagnostic procedures to characterise a cell of a specific tissue type and to determine whether contains a new ordinate expression of differentially expressed genes compound. The malignant. They may be used to screen for agents that condulate expression of the foreign gene in a particular cell type. For example, a promoter derived from a gene preferentially expressed in communer construct of the invential or a particular cell type. Contagnetic cells (antigen-presenting cells, or APCs), may be operably clinked to a sequence encoding an immunostimulatory molecule and a construct could be transduced into a sequence encoding an immunostimulatory molecule and a mand would be useful for inducing an immunostimulatory molecule and a mandal manda
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

Rchd005 is related to the rchd523 transmembrane polypeptide (see AAY7896) encoded by cDNA contained in the plasmid pfchd523. The rchd523 protein is differentially expressed in diseased cells compared to healthy cells. The rchd523 protein may be used as a marker protein for the diagnosis of cardiovascular diseases including atherosclerosis, ischaemia, reperfusion, hypertension, restenosis and arterial inflammation. rchd523 peptides may be used as antigens in the production of antibodies specific for rchd523. The anti-rchd523 antibodies may then be used in diagnostic assays to quantitate rchd523
                                                                                                                                                                                                                                                                                                                              Marker proteins for the diagnosis of cardiovascular diseases such as atherosclerosis and hypertension, comprising peptide sequences derived

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense cligonucleotides the A is replaced by a 'Universal' or alternative base. (C) isomulation and or alternative base. (I) can have respiratory, bronchodiator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with captivity of target polypeptides associated with Lung/respiratory disorders and malignancies, such as stimulating and cartiving peptide factors and transmitters, cranscription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokine receptors, cytokines and chemokine receptors, adenosine receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, contral creceptors, and peripheral nervous and non-nervous system (CNS) and peripheral nervous and non-nervous system (CT receptors, binding proteins and malignancy associated proteins. The receptors binding proteins and malignancy associated proteins. The creeptors binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders cincluding respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(les) and/or condition and associated with a disease or condition and and peripheral response or including respiratory obstruction which are associated with a disease or condition and and peripheral response or including respiratory obstruction with a way to including respiratory obstruction without an adsociated with a disease or condition and and or bronchoconstriction without and and seconds with a disease or condition without and and seconds with a disease or condition without and and seconds with a disease or condition without and and seconds and seconds and seconds and 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide fragments and antisense oligonucleotides used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Low adenosine (A) content antisense oligonucleotides which do not trigge adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions.
chronic obstructive pulmonary disease; pulmonary infection; bronchitis;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiliflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and cativity of target polypeptides associated with lung/respiratory disorders and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and nervous system (CNS) and peripheral nervous and non-nervous system peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      transmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or lung inflammation, allergy (ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, branchis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers

The polymorphic variant comprises at least one polymorphism selected from quanine at PS1, thymine at PS2, and adenine at PS4, or adenine at position corresponding to nuclectide 540. The HTR1B gene is useful for therapeutic purposes. It is useful in studying the expression and biological function HTR1B, as well as in developing drugs targetting this protein. It is also useful in diagnostics and forensic applications. Identification of an association for developing tests and therapeutic treatments for migraine and other neurological disorders. It is also used in gene therapy. The present DNA sequence is a primer which is used to detect the polymorphisms in HTR1B
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; cholinergic receptor, nicotinic, beta polypeptide 3; CHRNB3; single nucleotide polymorphism; SNP; drug screening; Alzheimer's disease; neurological disorder; gene therapy; genotyping; haplotyping; primer; ss.
                                                    gene therapy;
                                                                                                                                                                                                                                                                                                                                                                                   Polynucleotide useful for therapeutic purposes, comprises nucleotide polymorphisms in 5-hydroxytryptamine (serotonin) receptor 1B gene.

New polynucleotide, useful for studying expression and function of CHRNB3, comprises polymorphic variant of cholinergic receptor, nicotinic, beta polypeptide 3 (CHRNB3) gene, containing one of polymorphic sites PS1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine, cytostatic; virucidal; bactericidal; fungicidal; anti-parasitic; immunostimulatory; tumour; viral infection; bacterial infection; fungal infection; parasitic infection; cancer; asthma; infectious disease; allergy; immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                           The invention relates to methods for haplotyping cholinergic receptor, nicotinic, beta polypeptide 3 (CHRNB3) gene. The invention also provides single mucleotide polymorphisms (SNP) in the human CHRNB13 gene. Polymorphic variants of CHRNB13 gene is used for screening for candidate drugs to treat diseases related to CHRNB3 activity. They are also useful in studying the effect of variation on the biological activity of CHRNB3 swell as on the binding affinity of candidate drugs targeting CHRNB3 for treating Alzheimer's disease and other neurological activity of CHRNB3 are also useful in gene therapy. Compositions comprising CHRNB3 gene polymorphic variants are useful for genetyping and/or happlotyping a CHRNB3 gene in an individual. The present sequence is a primer used to detect human CHRNB3 gene polymorphisms. Human CHRNB3 gene includes 8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠ
                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                       response. The method comprises administering an immunostimulatory nucleic acid to a non-rodent subject in sufficient quantity to stimulate an immune response. The present sequence is one such immunostimulatory nucleic acids can be pyrimidine or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae, and/or orthomyxoviridae), bacterial antigens (e.g. toxoplasma, themory antigens and/or parasitic antigens. The method is staphylococcus), fungal antigens and/or parasitic antigens. The method is also useful for preventing cancer, asthma, infectious disease, allergy or immune deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce

                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific game expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                          New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                        New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAM63161-AAM64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitouely expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                         Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; transcriptome; gene expression pattern; cancer; drug screening;

                                     The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cencer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell.                                                                                                                                                                                                                                            ö
                                                                                                                                                                                              The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64721 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                        New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular cell types.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New isolated polynucleotides, useful for identifying specific cell type, such as cancer cell, comprises transcriptomes expressed in particular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; transcriptome; gene expression pattern; cancer; drug screening; cancer diagnosis; cell specific gene expression; ss.

                                                                       The present invention describes a method of identifying the type of cell in a sample, involving determining which of the sequences AAH63161-AAH64724 is expressed by the cell. The transcriptomes described in the invention are cell-type specific, cancer specific or ubiquitously expressed in humans. They can also be used to screen for drugs, reduce cancer specific gene expression, standardise expression and restore the function of a diseased cell or tissue. The present sequence is one of the transcriptomes described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes an lipopolysaccharide (LPS) activated human monocyte expression gene group consisting of the high-ranking 50 genes of the highest expression among the genes expressed by human monocyte stimulated by LPS in which the CDNA of each gene has the base sequence of (AAH32628 to AAH32677) continuous to the base sequence 5'-CANG-3' nearest to the polyA region. The gene group is useful for the development of new means for the diagnosis and the treatment of various human diseases in which human monocyte plays an important role. AAH3264s expression gene cDNA tegens from the present invention. AAH3294 represents an LPS activated human monocyte expression gene cDNA sequence encoding AAB98009, which are given in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                         The invention relates to a human normal hepatocyte expression gene group comprising 200 genes in the human normal hepatocyte. The cDNA of each gene comprises one of 200 fully defined nucleotide sequences as given in the specification. The gene group and the cDNAs corresponding to each of the genes in the group are useful in the diagnosis and treatment of human hepatopathy. The present sequence is a cDNA corresponding to a gene expressed by normal human hepatocytes

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonaminotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate of antifungal drugs comprising: (a) contacting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotidaes of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contioning expression in the yeast cell of at least 1 NORF gene whose expression is affected by the class of the cell cycle, the differentially ceptressed genes may be used as markers of phases of the cell cycle. The methods may be used to identify candidate drugs which affect the cell cycle and for identifying all carlots which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identification of antifungal drugs. ARP33268 to ARP43367 represent linkers and by Referential or the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes coding sequence of a yeast gene selected from 199 assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle scalected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for contribution buman penes which are involved in cell cycle progression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which a probe which comprises at least 10 contiguous nucleotides of a NORP gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cypast cell with a candidate drug and contacting a characteristic effect on gene expression in a cypast cell own pass of drugs in the yeast cell of at least 1 NORF gene whose expression is affected by the class of drugs. The NORF gene whose expression is affected by the class of drugs. The NORF gene whose cot of services and for identification of antidate drugs which affect the cell cycle and for identification of antidate drugs which affect the cell cycle and for identification of antidate drugs which affect the cell cycle method, in the exemplification of the present invention.

Cycle and for identification of the present invention of the present invention.
                                                                                                                                                                                                                                                                                                                                                    Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification;

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORP gene whose expression in a contiguous nucleotides of a NORP gene whose expression in a contiguous nucleotides of a NORP gene whose expression in a cyeast cell comprising contacting a yeast cell with a candidate drug as a member of a cyeast cell comprising contacting a yeast cell with a candidate of a cyeast cell comprising contacting a yeast cell with a candidate of a cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprision in the yeast cell of at least 1 NORP gene whose expression is affected by the class of drugs. The NORP gene whose cycle and for identify candidate drugs which a ffect the cell cycle and for identify candidate drugs which a ffect the cell cycle and for identify candidate drugs which a ffect the cell cycle and for identify candidate drugs and primers used in the exemplification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonanotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of antifungal drug; (a) contexting a test substance which a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression contiguous nucleotides of a NORF gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF genes may be used controling expression in the yeast cell of at least 1 NORF gene whose corpusors of the cell cycle. The captession and for identify candidate drugs which affect the cell cycle cycles and for identification of analy so the cell cycle, the differentially cyclessed genes may be used as markers of phases of the cell cycle. The cycles and for identification of antifungal drugs. ARF33268 to AAF43367 represent invention.

AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE method, in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                             Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonannotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also comprising a SAGE (serial analysis of gene expression) tag. Also comprising administering a NORF gene whose to affect the cell cycle sclussing two phases of the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for dentifying human genes which are involved in cell cycle progression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human DNA with a probe which comprises at least 10 contiguous nucleotides of a NORF gene whose expression varies as in M1, and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cyeast cell comprising contacting a yeast cell with a candidate drug and contacting expression in the yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and contacting expression is affected by the class of the cell cycle, the differentially expressed genes may be used as markers of phases of the cell cycle. The expressed genes may be used as markers of phases of the cell cycle or defined the cycle and for identification of antifungal drugs. ApR33268 to AAR44064 represent SAGE tags used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame; or nonamnotated ORF) genes coding sequence of a yeast gene selected from Jog comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle selected from log phase, 5 phase and G2/M; (2) a method (M2) for screening candidate contituous antifungal drugs comprising: (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for cell; and (b) monitoring expression of a NORF gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression contiguous nucleotides of a NORP gene whose expression varies as in M1; and (4) a method (M4) for identifying a candidate drug as a member of a class of drugs having a characteristic effect on gene expression in a cyeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprising contacting a yeast cell with a candidate drug and cyeast cell comprises of drugs whose expression is affected by the class of drugs. The NORP gene whose cycle and for identification of antidate drugs which affect the cell cycle and for identification of antidate drugs which affect the cell cycle and for identification of antidate drugs which affect the cell cycle represent SAGE tags used in the exemplification of the present invention.

Cycle and cycle and for identification of the prese
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                                                                                         Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF;
                                                                                                                                                                                                                                                                                                                               nor previously assigned open reading frame; nonannotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.
                                                                                                                                                                                                  Yeast NORF gene SAGE tag oligonucleotide SEQ ID NO:7721.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 10 BP; 2 A; 4 C; 4 G; 0 T; 0 U; 0 Other;

The present lime furcation describes an isolater Comparison of TAS NORP (not previously assigned open reading frame; or nonannotated ORP) genes coding sequence of a yeast gene selected from a group of 745 NORP (not previously assigned open reading frame; or nonannotated ORP) genes of comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORP genes to affect the cell cycle comprising administering a NORP gene whose expression varies by at class to the between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate antifungal drugs comprising; (a) contacting a test substance with a yeast cell; and (b) monitoring expression of a NORP gene whose expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of identifying human genes which are involved in cell cycle progression of identifying a candidate drug as a member of a contiguous nucleotides of a NORP gene whose expression in a contiguous nucleotides of a nord identification day have cell of at least 1 NORP genes may be used contitoring expression in the yeast cell of at least 1 NORP genes may be used to dentify candidate drugs which affect the cell cycle and for identification of antifungal drugs. ARF33268 to AAF44064 crepresent SAGS tags used in the exemplification of the present invention.

AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE crepted in the exemplification of the present invention.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previously assigned open reading frame, or nonamnotated ORF) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate contiguous lucy ecomprising: (a) contexting a test substance with a yeast cell; and (b) monitoring expression of a NORF gene whose expression of varies as in M1, where a test substance which modifies the expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression in a contiguous nucleotides of a NORF gene whose expression is affected by the class of drugs. The NORF genes may be used to strictung a yeast cell with a method (M4) for identifying a candidate drug as a member of a contiguous nucleotides of a NORF gene whose expression is affected by the class of the cell cycle, the differentially cexpressed genes may be used to identify candidate drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identify candidate and for iden
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Yeast gene coding sequences comprising NORF genes with serial analysis of gene expression (SAGE) tags, useful for studying, monitoring and affecting phases of the cell cycle.
                                                                                                                                                                                                                                          Yeast; Saccharomyces cerevisiae; characterisation; cell cycle; NORF; nor previously assigned open reading frame; nonamnotated ORF; SAGE; serial analysis of gene expression; antifungal; tag; identification; linker; PCR primer; ds.

The present invention describes an isolated DNA molecule comprising a coding sequence of a yeast gene selected from a group of 745 NORF (not previoually assigned open reading frame; or nonamontated ORP) genes comprising a SAGE (serial analysis of gene expression) tag. Also described are: (1) a method (M1) of using NORF genes to affect the cell cycle comprising administering a NORF gene whose expression varies by at least 10% between any two phases of the cell cycle selected from log phase, S phase and G2/M; (2) a method (M2) for screening candidate cell; and (b) monitoring expression of a NORF gene whose expression of antifungal drugs (a) contacting a test substance which see expression of the yeast gene is a candidate antifungal drug; (3) a method (M3) for identifying human genes which are involved in cell cycle progression of comprising contacting human DNA with a probe which comprises at least 10 contiguous nucleotidaes of a NORF gene whose expression in a contiguous nucleotidaes of a NORF gene whose expression in a contiguate drug and contacting a yeast cell with a candidate drug and contacting expression in the yeast cell of a least 1 NORF gene whose corpusions is affected by the class of the cell with a candidate drug and contacting expression in the yeast cell of at least 1 NORF gene may be used to study, monitor and affect phases of the cell cycle, the differentially expression is affected by the class of the cell cycle, the differentially expression is a markers of phases of the cell cycle, the differentially expression is a markers of phases of the cell cycle, the differentially expression is a markers of phases of the cell cycle, the differentially cycle cycle and for identify candidate drugs which affect the cell cycle and for identify candidate drugs which affect the cell cycle and for identify candidate drugs and for identify candidate drugs and for identify candidate drugs which are cell cycle and for identify candidate drugs which are candidated and for identify candidate drugs and contacting ex represent SAGE tags used in the exemplification of the present invention AAF33262 to AAF33267 represent linkers and PCR primers used in the SAGE

Genotyping human galanin receptor gene of an individual for determining haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the gene.

haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the gene.

Claim 18; Page 16; 99pp; English.

Claim 18; Page 16; 99pp; English.

The invention relates to genotyping human galamin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI cene present in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious diarrhoea and creating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds with GALRI activity. A GALRI polynucleotide or variant is useful in studying the expression and function of GALRI, and in expressing GALRI protein for use in screening for candidate drugs to treat disease related to GALRI activity. The polynucleotide or variant is useful for studying expression of the GALRI isogenes in vivo, for in vivo screening and testing of drugs cargeted against GALRI protein, and for studying the effect of the affinity of candidate activity of GALRI protein, and for studying the effect of the affinity of candidate activity of GALRI protein, and for studying the effect of the affinity of candidate activity of GALRI protein, and for studying the effect of the affinity of candidate activity of GALRI protein, and the studying the effect of the affinity of candidate activity of GALRI protein, and the biological activity of GALRI acceptance against GALRI protein, and the studying the effect of the affinity of candidate activity of GALRI acceptance activity of GALRI acceptance activity of GALRI acceptance infections diarrhoea and growth hormone insufficiency. AAS98289- AAS98408 represent human GALR1 gene allele-specific oligonucleotides used to detect GALR1 gene polymorphisms as described in the method of the candidate drugs targeting GALR1 for the treatment

The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI come or more polymorphic sites. The identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious diarrhoea and creating a specific condition or disease predicted to be associated with GALRI activity, and in the deeds of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds targeting GALRI to treat a specific conditions or disease associated with GALRI activity. A GALRI polymucleotide or variant is useful in studying the expression and function of GALRI, and in expressing GALRI protein for use in screening for candidate drugs to treat diseases related to GALRI activity. The polymucleotide or variant is useful for studying expression of the GALRI protein, and for studying the effect of the cariation on the biological activity of GALRI as well as on the binding affinity of candidate drugs targeting GALRI as well as on the binding affinity of candidate drugs targeting GALRI seed to the content of infectious diarrhoea and growth hormone insufficiency. AAS98189. AAS98408 infectious diarrhoea and growth hormone insufficiency. ASS98289. AAS98408 content whan GALRI gene polymorphisms as described in the method of the invention

Claim 18; Page 16; 99pp; English

The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI con an individual, inclaived in the individual, the identity of the nucleotide pair at cone or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious diarrhoea and growth hormone deficiency, to validate GALRI as a candidate agent for treating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to complete to careen for compounds targeting GALRI to treat a specific conditions or disease associated with GALRI activity. The method is useful for variant is useful in studying crargeting GALRI activity. The polynucleotide or variant is useful for studying expression of the expression and function of GALRI, and in expressing GALRI protein for activity. The polynucleotide or variant is useful for studying expression of the GALRI protein, and for studying such the binding craritation on the biological activity of GALRI as well as on the binding affections diarrhoea and growth hormone insufficiency. AAS99289- AAS98408 represent human GALRI gene applymorphisms as described in the method of the invention

The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI cone or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the cone or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the cone or more polymorphic sites. The method is useful for determining whether an individual has a haplotype pairs defined in the cone or specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, and in the design of clinical trials of candidate agent for treating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds with GALRI activity. A GALRI polymorleotide or variant is useful in studying creating charactivity. The pulymorleotide or variant is useful for studying expression continuous of the capted day polymorleotide or variant is useful for studying expression of the GALRI isogenes in vivo, for in vivo screening and testing of drugs targeted against GALRI protein, and for studying the effect of the cardidate drugs targeting GALRI for the treatment of affinity of candidate drugs targeting GALRI for the treatment of affinity of candidate drugs targeting GALRI for the treatment of infectious diarrhoea and growth hormone insufficiency. AAS98289- AAS98408 crepression thuman GALRI gene allele-specific oligonucleotides used to invention

The invention relates to genotyping human galanin receptor (GALRI) gene of an individual, involving determining for the two copies of the GALRI content in the individual, the identity of the nucleotide pair at one or more polymorphic sites. The method is useful for determining whether an individual has a haplotype or haplotype pairs defined in the specification. This is useful for improving the efficacy and reliability of several steps in the discovery and development of drugs for treating diseases associated with GALRI activity, e.g., infectious diarrhoea and creating a specific condition or disease predicted to be associated with GALRI activity, and in the design of clinical trials of candidate drugs creating a specific condition or disease predicted to be associated with GALRI activity. The method is useful to screen for compounds with GALRI activity. The method is useful to screen for compounds the expression and function of GALRI, and in stypessing GALRI protein for use in screening for candidate drugs to treat diseases associated with GALRI activity. The polymucleotide or variant is useful for studying expression of the polymucleotide or variant is useful for studying expression of the biological activity of GALRI as well as on the binding craffication on the biological activity of GALRI as well as on the binding crafficated dariant GALRI gene arregeting GALRI as well as on the binding crafficated dariant dariant mome insufficiency. AAS98289- AAS98408 represent human GALRI gene allele-specific oligonucleotides used to detect GALRI gene polymorphisms as described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Genotyping human galanin receptor gene of an individual for determining haplotype of an individual, involves determining the identity of nucleotide pair at specific polymorphic sites for two copies of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                               Galanin receptor; GALR1; human; single nucleotide polymorphism; SNP; drug discovery; haplotyping; infectious diarrhoea; growth hormone deficiency; allele-specific oligonucleotide; ss.
                                                                                                                                                                                                                                                                                                                                                                                                       Galanin receptor gene GALR1 allele-specific oligonucleotide #103.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Nandabalan K;

```
The patent discloses novel genetic variants of human apolipoprotein E
(APOE) gene. The invention also relates to compositions and methods for
haplotyping and/or genotyping the APOE gene. The haplotyping methods of
the invention are useful for improving the efficacy and reliability of
several steps in the discovery and development of drugs for treating
diseases associated with APOE activity, e.g. familial
dysbetalipoproteinaemia, type III hyperlipoproteinaemia, atherosclerosis,
and Alzheimer's disease. They are useful to validate APOE as a candidate
agent for treating a specific condition or disease predicted to be
associated with APOE activity and in the design of clinical trials of
candidate drugs for treating a specific condition or disease predicted to
be associated with APOE activity. Genotyping or haplotyping methods are
useful to screen for compounds targeting APOE to treat a specific
condition or disease associated with APOE activity. The present DNA
sequence is a primer which is used for detecting human APOE gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Genotyping human apolipoprotein gene of individual for determining haplotype of individual, involves determining identity of nucleotide pair at specific polymorphic sites for two copies of gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                          Human, antilipaemic; neuroprotective; nootropic; genetic variant; APOE; apolipoprotein E; haplotyping; familial dysbetalipoproteinaemia; therapy; genotyping; type III hyperlipoproteinaemia; Alzheimer's disease; atherosclerosis; polymorphism; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                        Human apolipoprotein E (APOE) gene polymorphism detecting primer #26.

                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                            activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL4267 to ABL4296 represent specifically claimed human maturation/activation C expression gene tags from the present invention
                                                                                                                                                                                                                                                                                                                                                              The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/

The present invention describes a human maturation/activation dendritic cell (DC) expression gene group consisting of 100 genes which show the highest expression among the genes expressed in human maturation/activation DC. Also described are: (1) a protein expressed by the above human maturation/activation DC expression gene; (2) an antibody against the protein; and (3) an antagonist against the expression of each gene belonging to the above gene group. The gene group is useful for the treatment and the diagnosis of various human diseases related to human DC. ABL4226 represent specifically claimed human maturation/activation DC expression gene tags from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel genetic variants of G protein-coupled receptor 7 gene useful for therapeutic purposes and for expressing GPR7 protein useful in identifying drugs to treat psychological and neurological disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

ઠે The invention relates to an isolated polymuclacotide (I) comprising a multicotide sequence which is a polymorphic variant of a reference sequence for a grpt. Only or its fragment or sequence for G-protein coupled receptor 7 (GRR7) gene or its fragment or sequence for G-protein coupled receptor 7 (GRR7) gene or its fragment or greatening the relations of the sequence of G-protein coupled receptor 7 (GRR7) gene or its fragment or fragment. The encoded polypeptide (II) is useful for identifying an association between a trait auch as a clinical response to a drug targeting GRR7 and septemballity in developing disgnostic relate and therapeutic treatments percentage for candidate drugs to creat diseases related to GRR7 and sexpression and function of GRR7 and expression gRR7 percent for use in stressing for candidate drugs to treat diseases related to GRR7 activity. The polymorphism and haplotype data are useful for valueding whether of RR7 is a suitable target for drugs to treat psychological and clustoped data are useful for valueding whether of RR7 is a suitable earget for drugs to treat psychological and clustoped data are useful for valueding whether of RR7 is set in the GRR7 haplotype of a palpotype and relability of several steps in clustoped grad development of drugs for treating diseases associated with GRR7 activity psychological and neurological disorders. For exactivity psychological and neurological disorders are pagetic condition or disease predicted to be associated with GRR7 activity psychological and neurological disorders on to screen consomonals that display the highest desired agonist or anagonist activity for cach of the most frequent GRR7 isoforms present in the population with the specific condition or disease of population in the specific condition or disease predicted to be associated with GRR7 activity for cach of the most frequent GRR7 isoforms present in the fortion of the variation on the biological activity of cach of the warfation on the biological activity of cach of the variation on t

New genetic variants of mucin 1, Transmembrane gene, useful in studying expression and function of protein encoded by the gene and for screening

drugs to treat diseases e.g. cancer. Claim 16; Page 14; 75pp; English.

Koshy B;

Chew A,

The invention relates to a polymucleotide (ABL60158, ABL60159) encoding mucin 1/MUC1 (ABB77476), Transmembrane isogene. The invention describes cover genetic variants of the MUC1 gene. The invention is useful for movel genetic variants of the MUC1 gene. The invention is useful for association between a trait and at least one of the haplotypes or association between a trait and at least one of the haplotypes or candidate drugs to treat diseases related to MUC1 protein for use in screening for candidate drugs to treat diseases related to MUC1 activity and in studying the effect of the variation on the biological activity of MUC1 candidate drugs to treat diseases related to MUC1 activity and in the treatment of e.g. cancer. MUC1 is further used by the pharmaceutical cressarch scientist to validate MUC1 as a candidate target for and in design of clinical trials of candidate drugs for, treating a specific condition drugs or disease predicted to be associated with MUC1 activity. MUC1 antibodies are useful in a variety of diagnostic and prognostic formats and therapeutic methods. The present sequence is that of a PCR primer for detecting MUC1 polymorphisms, useful to the invention ö Gaps ö 46.3%; Score 7.4; DB 1; Length 10; 88.9%; Pred. ```
The invention comprises DNA, cDNA and protein sequences of the human electron-transfer flavoprotein, beta polypeptide (ETFB) gene (located on electron-transfer flavoprotein, beta polypeptide (ETFB) gene (located on carcamome 19413.3-13.4). The invention specifically relates to the identification of 27 novel polymorphic sites within the ETFB gene.

C clor mine primary flavoprotein (ETF) is an obligatory electron acceptor components and is located in the mitochondrial matrix. ETF is composed of an alpha (ETFA) and a beta (ETFB) subunit. Electrons accepted by ETF are transferred to the mitochondrial respiratory chain by ETF are transferred to the component ETFB polymorphisms identified in the invention are useful compounds for genotyping and haplotyping the ETFB gene of an individual. The ETFB protein and nucleic acids of the invention are useful for studying the efficacy of therapeutic agents and compounds for glutaric acidsenia type II. The nucleic acids of the invention are useful for testing the efficacy of therapeutic agents and compounds for glutaric acidsenia type II. The nucleic acids of the invention are useful for testing the efficacy of therapeutic agents and compounds for glutaric acidsenia type II. The nucleic acids of the invention are useful in the production of a transgenic animal expressing the ETFB gene. Nucleic acids ABL39414-ABL39494 represent claimed ETFB conserved of all alleacypes of the ETFB and alleacype acids ABL39414-ABL39494 represent claimed ETFB and alleacype acids ABL39414-ABL39494 represent claimed alleacype acids are alleacype acids ABL394141-ABL39494 represent claimed acids

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to genetic variants of human endothelin 2 (EDN2)

gene. EDN2 gene contains 17 polymorphic sites PS1-PS17. The polymorphic
variants are useful in studying the expression and function of EDN2, in
expressing EDN2 protein for use in screening for candidate drugs to treat
diseases related to EDN2 activity, in studying the effect of the
variation on the biological activity of EDN2, and the binding affinity of
candidate drugs targetting EDN2 for the treatment of hypertension,
cardiovascular disorders, renal insufficiency and cerebrovascular
conditions. The haplotyping methods are useful in validating EDN2 as a
candidate target for treating a specific condition or disease predicted
to be associated with EDN2 activity, or in the design of clinical trials
of candidate drugs for treating a specific condition or disease
associated with EDN2 activity, Allele specific oligonucleotides (ASO) are
used as probes and primers, and for detecting polymorphism in EDN2 gene.
The present sequence is a primer used to detect polymorphism in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                New human endothelin 2 (EDN2) polymorphic variants and encoding genes, useful in expressing EDN2 protein for screening candidate drugs to treat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; electron-transfer flavoprotein beta polypeptide; ETFB; electron acceptor; mitochondrial matrix; glutaric acidaemia type II; novel polymcyphics it; novel polymcyphism; ETFB genotype; as; GAII; ETFB haplotype; transgenic animal; primer; probe; chromosome 19q13; primer-extension oligonucleotide; single nucleotide polymorphism; SNP.

The present invention describes a zinc finger protein (I) that binds to a target site, comprising a first (F1), a second (F2), and a third (F3) conversing a first (F1), a second (F2), and a third (F3) conversing (I), F2, F3 from N-terminus to C-terminus, where the carget site comprises, in 3'-5' direction, a first (S1), a second (S2), and a third (S3) target subsite. Also described are: (I) a polypeptide (II) comprising (I); (2) a polynucleotide (III) encoding (I) or (II); and (S1) described selecting the F1 zinc finger such that it binds to the S1 target subsite, selecting the F2 zinc finger such that it binds to the S2 target subsite, and selecting the F3 zinc finger such that it binds to the S3 target subsite, thus designing (I) that binds to a target site. (I) is useful for recognition of triplet target subsites (L) a starget subsite, thus designing (I) that binds to a target site. (I) is useful in studying gene function, and for human therapeutic methods to modulate the expression of a target region within a subject, in diagnostic methods for sequence specific detection of target nucleic acid can a sample, and in assays to determined the phenotype and function of can assays to determined the phenotype and function of carget sequences, as well as enhanced biological activity. AB071213 to their invention are given in the exemplification of the present invention in the exemplification of the present ö Novel genetic variants of human cofilin 1, CFL1 gene for studying expression, function of the gene and expressing CFL1 protein useful in identifying drugs to treat immunological disorders. ```
The invention relates to a novel polymucleotide sequence which is a polymorphic variant of a reference sequence for the cofilin 1 (nonmandel) (CFL1) gene or its fragment, or a polymorphic variant of a treference sequence for a CFL1 CDNA or its fragment. The polymucleotide of the invention may have a use in gene therapy, and in antisense gene therapy. The polymucleotide is useful for studying the expression and function of CFL1 and expressing CFL1 protein for use in screening for candidate drugs to treat diseases related to CFL1 activity. The polymorphism and haplotype data are useful for validating whether CFL1 is a suitable target for drugs to treat immunological disorders, screening for such drugs and reducing bias in clinical trials of such drugs. The present sequence represents one of a set of primer extension oligionucleotide PCR primers used in the invention to detect polymorphisms
                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention provides the protein, gene and cDNA sequences of human P450 (cytochrome) oxidoreductase POR, and single nucleotide polymorphisms (SNPs) identified therein. The sequences can be used to haplotype the POK gene of an individual, and to establish whether POR is a suitable target for drugs to treat cancer and disorders associated with impaired protein synthesis in cells. The present sequence is an allele specific primer extension oligonucleotide for the coding sequences of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New genetic variants comprising haplotypes of the P450 (cytochrome) oxidoreductase (POR) isogene, useful in improving the efficiency of drug screening protocols for compounds targeting POR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human P450(cytochrome) oxidoreductase ASO primer extension oligo #40.
                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; P450(cytochrome) oxidoreductase; POR; cancer; haplotype; SNP;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes genetic variants of the human glutathione reductase (GSR) gene (I). (I) has antianaemic activity and can be used in gene therapy. (I) can be used in screening for drugs targeting (I) that are useful for treating haemolytic anaemia. Methods from the present invention can be used: for improving the efficiency and reliability of several steps in the discovery and development of drugs for treating diseases associated with GSR activity; for haplotyping, which is also used by the pharmaceutical research scientist to validate GSR as a candidate target for treating a specific condition or disease predicted to be associated with GSR activity, e.g. haemolyric anaemia, and in the design of clinical trials for treating a specific condition of disease associated with GSR activity, and for screening compounds targeting GSR.

(I) is useful in studying the expression and function of GSR, and in expressing GSR protein for use in screening for candidate drugs to treat diseases related to GSR activity. (I) is also useful in studying the capterial and the biological activity of GSR activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the binding affinity of candidate drugs targeting GSR for the treatment of haemolytic anaemia. The present sequence represents a preferred oligonuclectide detection primer for the human GSR gene, which is given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New genetic variants of Glutathione reductase isogenes, useful for improving efficiency and reliability in drug development for treating

The invention relates to SAGE (serial analysis of gene expression) tags representing groups of genes which are expressed in activated human Th1 and/or Th2 cells. The SAGE tags of this invention consist of a sequence of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif lying nearest to the polya region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in Th1 and/or Th2 cells, antibodies against these proteins, and inhibitors of the expression of groups of genes that are expressed in minibitors of the expression of groups of genes that are expressed in
                                                                                                                                                                                                                                                                                                                                                                                                               either or both the two cell types. Groups of genes expressed in Thi and/or Th2 cell types may be used for the diagnosts and treatment of Th1 and Th2-related disorders. Sequences ABV7810-ABV78389 are SAGE tags representing 50 genes which are most highly expressed in Th2 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                Š
                                                                                                                                                                                                                                         The invention relates to SAGE (serial analysis of gene expression) tags
representing groups of genes which are expressed in activated human Thi
and/or Th2 cells. The SAGE tags of this invention consist of a sequence
of 10 nucleotides located downstream of the 5'-CATG-3' sequence motif
lying nearest to the polyA region of CDNAs derived from a variety of
genes. These tags serve to uniquely identify each transcript and can thus
types. The invention also relates to proteins encoded by the genes
cexpressed in Th1 and/or Th2 cells, antibodies against these proteins, and
inhibitors of the expression of groups of genes that are expressed in
cither or both the two cell types. Groups of genes expressed in Th1
and/or Th2 cells, antibodies against these proteins,
and/or Th2 cell types may be used for the diagnosis and treatment of Th1
and/or Th2 cell types which are most highly expressed in Th1 cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC;

The invention relates to SAGE (serial analysis of gene expression) tags
representing groups of genes which are differentially expressed in human
chronic hepatitis C (CH) liver tissue or hepatitis C-induced
chronic hepatitis C (CH) liver tissue or hepatitis C-induced
chronic advantance of HCC) compared with normal human liver tissue.

The SAGE tags of this invention consist of a sequence of 10 nucleotides
concated downstream of the 5'-CATG-3' sequence motif lying nearest to the
polyA region of cDNAs derived from a variety of genes. These tags serve
to uniquely identify each transcript and can thus be used to analyse the
polyA region of cDNAs derived from a variety of genes. These tags serve
to uniquely identify each transcript and can thus be used to analyse the
pattern of gene expression in particular cell types. The invention also
relates to proteins encoded by the genes expressed in chronic
liver tissue or HCC, antibodies against these proteins, and inhibitors of
the expression of groups of genes that are overexpressed in chronic
hepatitis C liver tissue or HCC. Groups of genes differentially expressed
to choric hepatitis C tissue or HCC. Groups of their expression
cractwity, and antibodies against the gene products may be used in the
development of drugs to treat chronic hepatitis C and/or HCC. Sequences
ABV84791-ABV84890 are SAGE tags repersenting 100 genes which are highly
expressed in chronic hepatitis C liver tissue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SAGE tag; serial analysis of gene expression; human; chronic hepatitis C; CH; liver tissue; hepatocellular carcinoma; cancer; tumour; HCC;

chronic hepatitis C (CH) liver tissue or hepatitis C-induced hepatitis C (CH) liver tissue or hepatitis C-induced hepatitis C (CH) liver tissue or hepatitis C-induced hepatocellular carcinoma (HCC) compared with normal human liver tissue. The SAGE tags of this invention consist of a sequence of 10 nuclectides located downstream of the 5'-CATG-3' sequence motif lying nearest to the polyA region of cDNAs derived from a variety of genes. These tags serve to uniquely identify each transcript and can thus be used to analyse the pattern of gene expression in particular cell types. The invention also relates to proteins encoded by the genes expressed in chronic hepatitis C liver tissue or HCC, antibodies against these proteins, and inhibitors of the expression of groups of genes that are overexpressed in chronic hepatitis C tissue or HCC may be used for the diagnosis and readment of these diseases. Such genes, inhibitors of their expression or activity, and antibodies against the gene products may be used in the development of drugs to treat chronic hepatitis C and/or HCC. Sequences ABV84791-ABV84890 are SAGE tags representing 100 genes which are highly expressed in chronic hepatitis C liver tissue ö monoamine; Gaps Human, solute carrier family 18 member 2; SLC18A2; vesicular monoan vesicular monoamine transporter; VMAT2; polymorphic site; SNP; sengle nucleotide polymorphism; antiinflammatory; neuroleptic; haplotyping; genotyphing; respiratory inflammatory disease; neuropsychiatric disorder; monoaminergic brain system; primer; ss. ; 0 Human SLC18A2 preferred oligonucleotide primer SEQ ID NO:76. 46.3%; Score 7.4; DB 1; Length 10; 88.9%; Pred. The present invention describes an isolated polynucleotide (I) having a sequence (S1) comprising soluble carrier family 18 (vesicular monoamine), member 2 (SLC18A2) isogene selected from 49 isogenes with regions of a sequence (SS) of 40023 bp (see ABL51954), and defined by a corresponding set of polymorphisms whose locations and identities are given in the

Novel genetic variants of soluble carrier family 18 (vesicular monoamine), member 2 gene useful for screening drugs to treat diseases e.g. neuropsychiatric disorders involving monoaminergic brain systems.

ö
specification; or a sequence (S2) complementary to (S1). (I) has antiinflammatory and neuroleptic activities, and can be used in gene therapy. Methods from the present invention can be used for haplotyping and genotyping the SLC18A2 gene in an individual. SLC18A2 is also known as the vestcular monoamine transporter (WMAT2). (I) is useful in studying the expression and function of SLC18A2, and in expressing the SLC18A2 protein for use in screening for candidate drugs to treat diseases related to SLC18A2 activity and in studying the effect of the variation on the biological activity of SLC18A2 as well as on the binding affinity of candidate drugs targeting SLC18A2 for the treatment of respiratory
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a polynucleotide comprising a first nucleotide sequence (NS1) comprising a 116 (interleukin-6, an inflammatory cytokine) isogene selected from isogenes 1-11 and 13-18 given in the specification, where each isogene comprises the regions of NS1 and is further defined by the corresponding sequence of polymorphisms whose locations and
                                                                                                                                                                                                          inflammatory diseases such as neuropsychiatric disorders involving monoaminergic brain systems. The present sequence represents a preferred oligonucleotide primer for human SLC18A2, which is given in the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Genetic variants of interleukin-6 isogenes for improving efficiency and reliability in drug development for treating myeloma, coronary artery

identities are defined in the specification (PS2-PS6, PS8 and PS10-PS17), or a second nucleotide sequence (NS2) complementary to NS1.

Alternatively, the sequence comprises a coding sequence for an ILG isogene. Also included are methods of halplotyping/ genotyping (and predicting the haplotype/genotype) of the ILG gene of an individual, capacity pair of the ILG gene, an isolated oligonucleotide for detecting a polymorphism in the ILG gene, an isolated oligonucleotide for detecting a polymorphism in the ILG gene, an isolated oligonucleotide, an isolated of transfermed or transfected with the ILG polymorphisms (III) comprising at least 10 and containing one of the identified single-nucleotide polymorphisms (SNP), an isolated correspond to the ILG isogene comprising at least 10 and containing one of the identified single-nucleotide polymorphisms (SNP), an isolated monoclonal antibody specific for the ILG gene, and a genome anthology for the ILG gene. The ILG gene, and a genome anthology for the ILG gene. The ILG computer system for storing and analysing polymorphism data for the ILG gene, and a genome anthology for the ILG gene. The ILG care useful for treating myeloma, coronary artery disease (CAD), architis, Kaposi sarcoma (associated with human immunodeficiency virus infection, HIV), hypercalcementa, bone disease, inflammatory disease, stunted growth and systemic onset juvenile chronic arthritis. The methods are useful for improving the efficiency and reliability in the discovery and development of furus and in the validation of ILG as a drug target. The antibody is useful in diagnostic, promorpriced and the promorprice
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The antibody is useful in diagnostic, prognostic and therapeutic methods. The Li6 isogene is useful in studying the expression and function of IL6, and in expression IL6 protein for use in screening for candidate drugs. The gene for Li6 is located on chromosome 7021-p15. The present sequence is the 3' terminus of an allele specific primer used to detect an IL6 polymorphism using the method of primer extension
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New small inducible cytokine subfamily B (Cys-X-Cys), Member 14 (SCYB14) gene polymorphic variants, for studying the expression and function of SCYB14 and screening candidate drugs for treating disorders involving
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

The present invention describes genetic variants of the human small inducible cytokine subfamily B (Cyg-X-Cyg), Member 14 (BRAK) (SCYB14) gene. SCYB14 sequences have antiinflammatory activity. The polymorphic variants are useful in studying the expression and function of SCYB14, in expression and function of SCYB14, in expression and function of SCYB14, in expression and function of SCYB14 in expression and function of SCYB14 in expression and function of SCYB14 in expression and function of the cartation on the biological activity of SCYB14, and the binding affinity of candidate drugs targeting SCYB14 for the treatment of disorders involving inflammatory responses. Haplotyping methods from the present involving inflammatory responses. Haplotyping methods from the present involving inflammatory responses. Baplotyping methods from the present involving a specific condition or disease predicted to be associated with SCYB14 activity, or in the design of clinical trials of candidate drugs for treating a specific condition or disease associated with SCYB14 activity, Transgenic animals are useful for studying expression of the SCYB14 isogenes in vivo, for in vivo screening and testing of drugs targeted against SCYB14 protein, and for testing the efficacy of therapeutic agents and compounds for disorders related to platelet against an abiological system. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New small inducible cytokine subfamily B (Cys-X-Cys), Member 14 (SCYB14)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene polymorphic variants, for studying the expression and function of SCYB14 and screening candidate drugs for treating disorders involving
                                                                                                                                                                                                                                                                                                                                                                                                                                                              aggregation in a biological system. The present sequence represents a preferred oligonucleotide detection primer for the human SCYB14 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human SCYB14 preferred oligonucleotide detection primer SEQ ID NO:31.

conducible cytokine subfamily B (Cys-X-Cys), Member 14 (BRAK) (SCYB14)
gene. SCYB14 sequences have antinflammatory activity. The polymorphic
variants are useful in studying the expression and function of SCYB14, in
expressing SCYB14 protein for use in screening for candidate drugs to
treat diseases related to SCYB14 activity in studying the effect of the
variation on the biological activity of SCYB14, and the binding affinity
of candidate drugs targeting SCYB14 for the treatment of disorders
involving inflammatory responses. Haplotyping methods from the present
involving inflammatory responses. Haplotyping methods from the present
treating a specific condition or disease associated with
SCYB14 activity, or in the design of clinical trials of candidate drugs
cor treating a specific condition or disease associated with SCYB14
cotrivity. Transgenic animals are useful for studying expression of the
SCYB14 isogenes in vivo, for in vivo screening and testing of drugs
therapeutic agents and compounds for disorders related to platelet

New nucleic acid regulatory sequences, which are able to regulate

ö

a cyclin D1 promoter, a GD40 promoter, nucleus actuaristication described an insulator and comparator (RR) promoter. Human epidermal growth factor receptor 2 (HER2) promoter, or a beta lactamase conditions and promoter, androgen receptor (RR) promoter. Human epidermal growth factor receptor 2 (HER2) promoter, or a beta lactamase (Bla) promoter. Transcripton requiates may be used to comparate and promoter, and may be incorporated into perably linked to the promoter, and may be incorporated into cherchologous nucleic acid constructs for use in regulated expression of transgenes. Regulated expression of cyclin D1 can be used in cancer therapies, such as breast, colon or pancreatic cancers and familial adenomatous polyposis. Regulation of the activity of CD40 gene promoter may be used in the treatment of immunological disorders, such as autoimmune diseases e.g. multiple sclerosis (MS), systematic lupus erythematosus (SLE), graft-vs-host disease (GVHD) and rheumatoid arthritis. Regulated expression of genes under the control of the HBV (hepatitis B)-specific core, pre-S and X promoters can be used in the therapy of HBV disease, chronic hepatic insufficiency, cirrhosis, hepatic-linguistic genes. Regulated expression of the vahl gene promoter can be used in treatment of Enterococcus infection, while regulated expression of the androgen receptor gene can be used in the treatment of prostate cancer. This sequence represents a mutated promoter region used in the invention to determine the regulatory regions involved in gene in the regulatory regions involved in gene in the control of the invention. ö expression of a gene operably linked to a promoter, useful for regulating the expression of transgenes and for treating e.g., cancer and immunological diseases. Human; ss; lysosomal acid phosphatase 2; ACP2; gene; chromosome 11; lysosome-specific enzyme; orthophosphoric monoester hydrolysis; Hodgkin's disease; HD; acid phosphatase deficiency; novel polymorphic site; ACP2 haplotype; ACP2 genotype; polymorphism; transgenic animal; primer, probe; primer-extension oligonucleotide; SNP; single nucleotide polymorphism. invention describes an isolated nucleic acid regulatory sequence for Human lysosomal acid phosphatase 2 primer-extension oligonucleotide 5.                                                                                                                                                      The invention comprises the human lysosomal acid phosphatase 2 (ACP2)

CC nucleic acid and protein sequences. Specifically, the invention relates

CC to the discovery of 22 novel polymorphic sites within the APC2 gene. The

invention also comprises methods for haplotyping and genotyping the ACP2

Gene in an individual. The ACP2 gene (located on chromosome 11) encodes a

CC gene in an individual. The ACP2 gene (located on chromosome 11) encodes a

CC gene in an individual in the Catalyses the hydrolysis of

CC orthophosphoric monoesters to alcohol and phosphate. The ACP2 gene and

CC discase (HD) and acid phosphatase deficiency. The novel ACP2 gene

CC discase (HD) and acid phosphatase deficiency. The novel ACP2 gene.

CC discase (HD) and acid phosphatase deficiency. The novel ACP2 gene.

CC drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's

CC drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's

Cd disease and acid phosphatase deficiency). The ACP2 gene polymorphisms are

CC drugs) for treating an ACP2-related disease or condition (e.g. Hodgkin's

CC tests and therapeutic treatments. The ACP2 gene polymorphisms are

CC tests and therapeutic treatments. The ACP2 protein and nucleic acids of

CC tests and therapeutic freatments. The ACP2 protein and nucleic acids of

CC tests and therapeutic protein. The ACP2 nucleic acids of the invention are

CC useful in the production of allele-specific probes. Mucleic acids ABI36321

CC represent claimed ACP2 allele-specific probes. Nucleic acids ABI36321

CC ABI36364 represent claimed ACP2 allele-specific probes.

CC acids ABI36364-ABI36408 represent claimed ACP2 primers.

The sequence can be used in the treatment of disorders associated with NPY, including atheroselorosis, obesity, psychological disorders and alcoholism. The present sequence is an allale specific primer extension oligonucleotide used to isolate the human NPY coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention provides the human neuropeptide Y (NPY) gene and single nucleotide polymorphisms (SNPs) identified therein. The sequence can be used in the treatment of disorders associated with NPY, including atherosclerosis, obesity, psychological disorders and alcoholism. The present sequence is an allake specific primer extension oligonucleotide used to isolate the human NPY coding sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human, neuropeptide Y; NPY; isogene; SNP; atherosclerosis; obesity; psychological disorder; single nucleotide polymorphism; alcoholism; antiarteriosclerotic; anorectic; PCR; primer extension oligonucleotide;
New genetic variants of the human Neuropeptide Y (NPY) gene useful for treating disorders affected by abnormal expression or function of NPY isogene e.g., atherosclerosis or obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New genetic variants of the human Neuropeptide Y (NPY) gene useful for treating disorders affected by abnormal expression or function of NPY isogene e.g., atherosclerosis or obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

```
The invention relates to an isolated polynucleotide comprising a sequence selected from a polymorphic variant of calmodulin 1 (CALMI). The polymorphic variant comprises an CALMI isogene defined by a haplotype selected from haplotypes 1-21 given in the specification. The polymorphisms are useful for studying this protein for the treatment of a disorder related to its abnormal expression or function of CALMI as polymorphic variants may also be used in screening for compounds targeting CALMI to treat a specific condition or disease predicted to be associated with CALMI activity. Betablishing CALMI haplotype or haplotype pair of an individual is useful for improving the efficiency and celiability of several stepps in the discovery and development of drugs for treating diseases associated with SCYMA activity, e.g. Alzheimer's disease and diseases involving defects in calcium-dependent signal transduction. Haplotyping the CALMI gene in an individual is also useful in the design of clinical trials of candidate drugs for treating a specific condition on these predicted to be associated with CALMI and in the design of clinical trials of candidate drugs for treating a specific condition on the design of candidate drugs for treating a since the calmidate drugs for treating and activity of specific condition on a disease predicted to be associated with CALMI

Each polypeptide comprises a first or second zinc finger domain. The domains of each polypeptide are identical to a zinc finger domain from a naturally occurring protein and either do not occur in the same naturally occurring protein or occur in the same naturally occurring protein or occur in the same naturally occurring protein in a different configuration than in the polypeptide. The domains vary among polypeptides. Also described: (1) producing chimeric nucleic acids; (2) generating an artificial zinc finger polypeptide that specifically binds to a target DNA site; and (3) identifying a nucleic acid encoding a zinc finger polypeptide that specifically recognises a target DNA site. The library can be used for producing chimeric nucleic acids. ACC41551 to ACC41758 and ABR40919 to ABR41015 represent nucleotide and amino acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New library comprising polypeptides having zinc finger domains, useful for producing chimeric nucleic acids.
                                                                                                Zinc finger protein DNA-binding domain target sequence SEQ ID NO:210.

Designing zinc finger protein that has three zinc fingers from N-terminus and C-terminus that bind to subsites in 3' to 5' direction, in a target site, by selecting zinc fingers that bind their respective subsites.
                                                                                                                                                                                                                         The invention relates to a method of designing a zinc finger protein. The method is useful for designing a zinc finger protein. The method provides multi-finger zinc finger proteins with improved affinity and specificity for their target sequences, as well as enhanced biological activity. The present sequence represents a zinc finger protein DNA target sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes a method for preparing an insoluble fusion protein comprising a heparin-binding protein (HBP), a cleavage site and a second polypeptide, in recombinant bacterial cells by obtaining a precipitate comprising the fusion protein in the insoluble fraction of a host cell lysate. Also described: (1) producing a recombinant HBP in bacterial cells; (2) a DNA construct comprising a DNA sequence encoding HBP, which is fused in frame to a DNA sequence encoding a protease cleavage site, which in turn is fused in frame to a DNA sequence encoding a second polypeptide; (3) a recombinant expression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           insoluble fusion protein; heparin-binding protein; HBP; antibacterial; bacterial disease; linker; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention comprises a method for the PCR amplification of nucleic acids. The method involves a set of primers, where two of the primers are in solution and at least two other primers are attached to a solid support. The method of the invention can be used for the analysis of a nucleic acid or a mixture of nucleic acids, including: single-stranded DNA molecules, double-stranded DNA molecules and mRNA molecules. The present DNA sequence represents a random amplified polymorphic DNA (RAPD)
                                                                                                                                                                                                                                                                                                                                                  Amplification of nucleotide sequences from polynucleotides by chain extension of oligonucleotide primers, comprises 2 oligonucleotides in solution, 2 attached to supports and both share complementary sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

ö damaged pre-auricular skin and sun-protected post-auricular skin as well as sun-protected epidermis. The method involces: using at least one marker of photodamage comprising one of 15 fully defined sequences (S1-15) as given in the specification; and detecting a change in the marker to determine the presence of photodamage. The method is useful for detecting photodamage, aging, dry skin or oily skin. This sequence represents a SAGE sequence tag used as a marker for detecting photodamage vector including the DNA construct of (2); and (4) a fusion protein comprising an amino acid sequence of HBP, an amino acid sequence of a second polypeptide and an amino acid sequence of a protease cleavage site, the amino acid sequence of the protease cleavage site, the amino acid sequence of the protease cleavage site being positioned between the amino acid sequences of HBP and the second polypeptide, where the second polypeptide provides the fusion protein with capabilities of forming insoluble aggregates in cytoplasm of bacteria after being expressed in the bacteria. HBP has antibacterial activity. The method is useful for producing an insoluble fusion protein. The fusion protein is useful for producing an HBP which may be used for preparing a medicament. The medicament may be used for treating mammals having a bacterial disease state. The present sequence represents a linker oligonucleotide which is used in the exemplification of the personal care method; photodamage; Serial Analysis of Gene Expression; SAGE; sun-damage; pre-auricular skin; sun-protected post-auricular; sun-protected epidermis; aging; dry skin; oily skin; photodamage marker; The invention describes a personal care method of detecting photodamage comprising comparative Serial Analysis of Gene Expression (SAGE) of sun-Personal care method for detecting photodamage, aging, dry or oily skin comprises detecting gene markers upregulated in pre-auricular skin.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a personal care method of detecting photodamage comprising comparative Serial Analysis of Gene Expression (SAGE) of sundamaged pre-auricular skin and sun-protected post-auricular skin as well as sun-protected epidermis. The method involces: using at least one marker of photodamage comprising one of 15 fully defined sequences (S1-15) as given in the specification; and detecting a change in the marker to determine the presence of photodamage. The method is useful for detecting photodamage, aging dry skin or oily skin. This sequence represents a SAGE sequence tag used as a marker for detecting photodamage
                                                                                                                                                                                                                                                                                                                      personal care method; photodamage; Serial Analysis of Gene Expression; SAGE; sun-damage; pre-auricular skin; sun-protected post-auricular; sun-protected epidermis; aging; dry skin; oily skin; photodamage marker;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Personal care method for detecting photodamage, aging, dry or oily skin comprises detecting gene markers upregulated in pre-auricular skin.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.
                                                                                                                                                                                                                                                                                                                                The invention relates to a new isolated nucleic acid which comprises rchd005, rchd024, rchd032, rchd036, rchd502, rchd523, rhd528, or rchd534 genes. The nucleic acids are useful for treating and diagnosing cardiovascular diseases, such as atherosclerosis, ischaemia/reperfusion, hypertension, restenosis and arterial inflammation. The genes identified may be used diagnostically or as targets for therapeutic intervention. The present sequence represents a differential display primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; antisense; lung dysfunction, nasal airway dysfunction; antiinflammatory; steroid; ubiquinone; antiinflammatory; antiallergic; antiasthmatic; hypotensive; immunosuppressive; cytostatic; gene therapy; antisense gene therapy; respiratory; lung; adenosine sensitivity; adenosine receptor; bronchodilation; bronchoconstriction; lung allergy; lung inflammation; respiratory disease; ds.
                                                                                                                                                                                                                                 New fingerprint genes useful for treating and diagnosing cardiovascular diseases, e.g. atherosclerosis, ischemia/reperfusion, or hypertension.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               46.3%; Score 7.4; DB 1; Length 10; 88.9%; Pred. No. 2.8e+02;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention describes a personal care method of detecting photodamage Comprising comparative Serial Analysis of Gene Expression (SAGE) of sundamaged pre-auricular skin as well as sun-protected post-auricular skin as well as sun-protected epidermis. The method involces: using at least one marker of photodamage comprising one of 15 fully defined sequences (S1-15) as given in the specification; and detecting a change in the marker to determine the presence of photodamage. The method is useful for detecting photodamage, aging, dry skin or oily skin. This sequence

The invention describes a new zinc finger protein that binds to a target site comprising a first (F1), a second (F2) or a third (F3) zinc finger, ordered F1. F2 and F3 from N-terminus to C-terminus. The target site comprises, in the 3' to 5' direction, first (F1), second (S2) and third (S3) target subsites. The zinc finger proteins can be used for eccognising trippet target subsites having the nucleotide G in the 5'-most position of the subsite, that has been optimised with respect to the location of the subsite within the target site. This sequence represents the target polynucleotide of a synthetic zinc finger protein of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New microarray for measuring gene expression characteristics of hematopoietic cells, useful for preparing a composition for diagnosing or treating myeloid leukemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention describes a microarray for measuring gene expression characteristics of haematopoietic cells comprising at least 5 polymucleotides having distinct sequences. Also described are: a method of diagnosing or treating an abnormality associated with haematopoiesis, and diagnosing myeloid leukaemia in a patient. The microarray is useful for preparing a composition for diagnosing or treating myeloid leukaemia. This sequence represents a polymucleotide probe comprising a portion of an expressed gene isolated from a population of CDI5+ myeloid cells and suitable for use in the microarray of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; gene therapy; microarray; gene expression characteristic; haematopoietic cell; haematopoiesis; myeloid leukaemia; probe; CD15+ myeloid cell; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates a method to the detection of photodamage comprising using a marker of photodamage and detecting a change in the marker to determine the presence of photodamage. The marker is a nucleic acid having cDNA sequence of 11 or 10 base pairs. Detection is done by comparing a first skin sample with a second skin sample to determine a change in a marker. The method is used for detecting a skin condition, e.g. photodamage, aging and drying. The method provides an easy way to track expression of even small numbers of genes in laboratory models or in human tissue. The present sequence represents a photodamage marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Detection of skin conditions e.g. photodamage, aging and drying, comprises using polynucleotide sequences in gene arrays as markers, and detecting a change in the markers.

                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                       The invention relates a method to the detection of photodamage comprising using a marker of photodamage and detecting a change in the marker to determine the presence of photodamage. The marker is a nucleic acid having cDNA sequence of 11 or 10 base pairs. Detection is done by comparing a first skin sample with a second skin sample to determine a change in a marker. The method is used for detecting a skin condition, e.g. photodamage, aging and drying. The method provides an easy way to track expression of even small numbers of genes in laboratory models or in human tissue. The present sequence represents a photodamage marker used in the method of the invention.
                                                                                                                                                                                                               Detection of skin conditions e.g. photodamage, aging and drying, comprises using polynucleotide sequences in gene arrays as markers, and detecting a change in the markers.

The invention relates a method to the detection of photodamage comprising using a marker of photodamage and detecting a change in the marker to determine the presence of photodamage. The marker is a nucleic acid having cDNA sequence of 11 or 10 base pairs. Detection is done by comparing a first skin sample with a second skin sample to determine a change in a marker. The method is used for detecting a skin condition, e.g. photodamage, aging and drying. The method provides an easy way to track expression of even small numbers of genes in laboratory models or in human tissue. The present sequence represents a photodamage marker used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antialergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis;

This invention describes a noves composition is a rist active agent, comprising oligomucleotides, effective for alleviating critication, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and creducing adenosine eansitivity, levels of adenosine (A) or (A) receptors, cateducing adenosine earsitivity, levels of adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The oligomucleotides are derived from a gene encoding or regulating cypression of a target polypeptide associated with lung airway or lung dysfunction also describes a kit, that comprises: (a) adelivery or lung device, in separate containers, (b) the oligomucleotides, (c) fer invention as antiallergic, antiinflammatory, antiasthmatic, of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary disease, pulmonary condition such as pulmonary disease, pulmonary condition such as pulmonary disease, pulmonary infection, bulmonary infection, bulmonary infection, bulmonary infection, bulmonary interest characterial the pracet in the target RNA serves to prevent the broadcase.

The reduced adenosine content of the enti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the broadcast in the paraget RNA serves to prevent the broadcast in the paraget RNA serves to prevent or prevent in the paraget RNA serves to prevent in the par
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; emphysema; chronic obstructive pulmonary disease; bronchitis; pulmonary transplantation rejection; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                             invention describes a novel composition (a) a first active agent,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human adenosine Al receptor oligonucleotide fragment 714.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 10 BP; 1 A; 3 C; 5 G; 1 T; 0 U; 0 Other;

Title linus interaction describes a moves comperising oligonucleotides, effective for alleviating become comperising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction, respiratory tract inflammation, allergies and bronchoconstriction or hyposecretion, when administered to a mammal. The surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery of instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiastmatic, of the invention has antiallergic, antiinflammatory, antiastmatic, of treating a respiratory, immunosuppressive and cytostatic activity, is a composition capacity or composition is useful for preventing or treating a respiratory, lung or mailgnant disease. The administered composition or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and/or lung pulmonary observations. inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of t free adenosine into the system tissue environment and thereby, to This invention describes a novel composition (a) a first active agent, Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted truncleic acids associated with lung airway or lung dysfunction, and Pabalan J, Aguilar 46.3%; Score 7.4; DB 1; Length 10; 88.9%; Pred.                                                                                                                                                                                                        comprising detecting a change in a photodamage marker. Photoaging is an environmentally-induced remodeling of the dermis that arises as a result of repeated exposure of skin to sunlight. It has been suggested that photoaging is the predominant contributing factor to the prematurely-aged appearance of sun-exposed skin. The method of the invention may be useful for detecting photodamage and for comprehensive skin condition studies to elucidate new pathways. The current sequence is that of a human photodamage marker ISC (expressed sequence tag) of the invention which is most abundant in post-auricular skin. The current sequence was identified via comparison of SAGE (serial analysis of gene expression) libraries for

The invention relates to an isolated nucleic acid (appearing as ADF91272-
CC ADF91278 and ADF91307 which are up regulated or down regulated
CC (differentially displayed) in individuals genetically predisposed to
CC andiovascular disease. It may be up regulated by treatment with
CC interleukin (IL) 1 or treatment with shear stress. It may be down
CC diet. Also included are a nucleotide vector containing the nucleotide
CC diet. Also included are a nucleotide vector containing the nucleotide
CC diet. Also included are a nucleotide vector containing the nucleotide
CC diet. Also included are a nucleotide vector containing the nucleotide
CC diet. Also included are a nucleotide vector containing the nucleotide
CC diet. Also included are a nucleotide vector containing the nucleotide
CC dispense (comprising a gene or at sevent and includiovascular disease states)
CC dardiovascular disease (comprising administering a compound that
CC andiovascular disease (comprising administering a compound that
CC andiovascular disease (comprising administering the efficacy of a compound in clinical trials for the treatment of cardiovascular disease
CC compound in clinical trials for the treatment of cardiovascular disease
CC compound and activity of multiple transmembrane domain receptor target gene product (comprising a gene or its gene product, which is differentially
CC expressed in cardiovascular disease states), and identifying a compound
CC that modulates the activity of multiple transmembrane domain receptor
CC expressed and activator of the multiple transmembrane domain receptor
CC within the first cell; and comparing the level to that of a second
CC within the first cell; and comparing the level to that of a second
CC within the first from that of the second cell, the cardiovascular disease
CC compound so that if the level of intracellular calcium release within the
CC straget product has been identified). The invention is for use in the
CC cardenial/repertansion, hypertension or restencial a simple and stepid
CC inflammation
Isolated nucleic acid for use in treatment of cardiovascular diseases e.g. atherosclerosis, contains nucleotide of sequences having specified number of base pairs or nucleotide sequence of gene or gene fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  88; primer library; extendable oligo, EO; ligation chain reaction; LCR; rolling circle amplification; strand displacement amplification;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       peutically. It provides a simple and rapid cation of useful therapeutics. The present used to isolate cDNA differentially displayed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Extendable oligo E230 for DNA sequencing and PCR amplification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                  This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short coligonucleotide primers, also known as extendable oligos (BOB), for their template sequences. The present invention describes improved methods for be useful for PCR, RT-PCR, ligation chain reaction of DNA that can amplification, strand displacement amplification and isothermal DNA amplification. Accordingly, these extendable oligos with improved amplification. Accordingly, these extendable oligos with improved from biotechnology and agriculture to medical research. This oligonucleotide sequence is an extendable oligonucleotide that includes an adenine replacement 2,4 diaminopurine nucleotide analogue in the catch region, and is useful for both DNA sequencing reactions and PCR region, and is useful for both DNA sequencing reactions and PCR
                                                                                                                                                                                                                Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and extension of the EO.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ss; primer library; extendable oligo; BO; ligation chain reaction; LCR; rolling circle amplification; strand displacement amplification; isothermal DNA amplification; biotechnology; agriculture; medical research; 2,4 diaminopurine nucleotide analogue; PCR; primer.

This invention relates to a novel method for the optimisation of primer libraries. Specifically, it refers to increasing the affinity of short oligonucleotide primers, also known as extendable oligos (EOS), for their template sequences. The present invention describes improved methods for sequencing and the linear and exponential amplification of DNA that can be useful for PCR, NF-PCR, ligation chain reaction of EONA that can amplification, strand displacement amplification and isothermal DNA amplification, accordingly, these extendable oligos with improved specificity and affinity are particularly important in fields ranging from biotechnology and agriculture to medical research. This oligonucleotide sequence is an extendable oligonucleotide that includes an adenine replacement 2, diaminopurine mucleotide analogue in the catch region, and is useful for both DNA sequencing reactions and PCR mamplification in an exemplification of the invention.
                                                                                                                                                                                                                                                                                 Increasing the affinity of an extendable oligonucleotide (EO) for a target nucleic acid, for providing primers having improved specificity, comprises hybridization of the EO to a template oligonucleotide (TO) and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gapa

                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                    The invention relates to regulating expression of a gene in a cell comprising contacting a cell containing flavin adenine dinucleotide (FAD) and a gene operatively-linked to a light-responsive regulatory sequence with a white collar (WC)-1/WC-2 transactivator that binds FAD and the light-responsive regulatory sequence. Also included are a light-responsive regulatory sequence (or light responsive element, LRE) appearing as ADJ65134, ADJ65135, and ADJ65136 (LREs from the N. crassa frq gene promoter) and a kit comprising a WC-1/WC-2 transactivator and a light-responsive regulatory sequence. The method and kit are useful for regulating gene expression using light. The present sequence is an LRE (comprising an imperfect repeat) from the Neurospora crassa frq gene promoter which binds the WC-1/WC-2 transactivators.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense oligonucleotides (ADM76030 and ADM76031) targeted to the human NEPHA gene (ADM76029), which encodes a novel brain-derived ephrin receptor (ADM76028). The NEPHA protein has 50.7% homology to the human EphA7 ephrin receptor and its gene is located on chromosome 1. Ephrin receptors are overexpressed in various cancers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antisense oligonucleotide useful as anticancer agent for preventing cancer e.g. lung cancer, stomach cancer, breast cancer.
                       Regulating expression of a gene in a cell comprises contacting a cell containing FAD and a gene operatively linked to a light-responsive regulatory sequence with a WC-1/WC-2 transactivator.
                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            drug screening; antisense therapy; gene therapy; cancer; tumour; lung cancer; ovarian cancer; breast cancer; cervical cancer; prostate cancer; bladder cancer; stomach cancer; colorectal cancer; cytostatic; transcriptional control region; promoter; transcription site; ds.

ö and it has been found that inhibition of NEPHA expression promotes apoptosis. The invention also relates to the NEPHA transcriptional control (promoter) region (ADM76037); recombinant vectors and host cells comprising the NEPHA promoter operably linked to a reporter gene; a method of screening for compounds which inhibit or activate transcription of the NEPHA gene; and pharmaceutical compositions comprising an antisense oligonucleotides and modulators of NEPHA transcription represent inhibitor or activator. The antisense oligonucleotides and modulators of NEPHA transcription are useful for inducing apoptosis for the treatment and/or prevention of cancers in which NEPHA is overexpressed auto as and cancer, ovarian stomach cancer and colorectal cancer. Sequences ADM76038-ADM76371 represent transcription for transcription for transcription for a force and colorectal cancer. Sequences ADM76038-ADM76371 represent transcription for the property of th A kit comprising a set of oligonucleotides designed for identifying at least one of the alleles at each polymorphic site (PS) in a set of 129 polymorphic sites (PSS) given in the specification, is new. The kit identifies at least one of the alleles at each polymorphic site (PS) in a set of 129 polymorphic sites (PSS) given in the specification, for example: PSI and PS42; PSI9 and PS42; PS3, PSI2, and PS42; a set of polymorphic sites comprising a linked haplotype to any one of haplotypes 101-194, 201-463 or 501-515 given in the specification; or a set of polymorphic sites comprising a substitute haplotype for any one of haplotypes 101-194, 201-463 or haplotypes 501-515 given in the New kit comprising a set of oligonucleotides, useful for determining whether an individual has a statin response marker I or II for preparing a composition for treating hyperlipidemia. Hyperlipidemia treatment associated human ITGB3 haplotype probe #141. determining the copy number in the individual or a haplotype and assigning the individual to the first statin response marker group if the individual has at least one copy of the selected haplotype and to the second statin response marker group if the individual has zero copy of the selected haplotype; and assigning the individual to the first statin response marker group if the individual has zero or one copy of the selected haplotype and to the second statin response marker group if the individual has two copies of the selected haplotype. The determining step comprises genotyping each polymorphic site in a set of polymorphic sites
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukine, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The invention relates to a method of diagnosis (MI) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.8, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                           Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                 The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.e, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (C) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing cancer cells. The method is used for diagnosing breast cancer. This sequence corresponds to an oligonucleotide primer used in the method of the invention.
                                                                                                                                                                     Diagnosing breast cancer comprises determining expression levels of a gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Diagnosing breast cancer comprises determining expression levels of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
gene selected from those differentially expressed in normal or cancerous cells of a breast tissue sample including interleukin 1, thrombospondin 1 and cystatin C.
                                                                                                                          The invention relates to a method of diagnosis (M1) comprising: (a) providing a test sample of breast tissue; (b) determining the level of expression in the test sample of a gene (e.g. interleukin.e, superoxide dismutase 2 and tubulin, alpha 3) selected from Table 1 given in the specification, and (c) if the gene is expressed in the test sample at a lower level than in a control normal breast tissue sample, diagnosing the test sample as containing corresponds to an oligonucleotide primer breast cancer. This sequence corresponds to an oligonucleotide primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity of expressed product.
                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying agents that alter biological activity of a polypeptide encoded by a polymucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity of expressed product.

DNA probe design information-processing method in nucleic acid sequence analysis system, involves extracting probe candidate based on extracted partial base sequence with respect to obtained self/competition frequency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   /*tag= a/mod_base= OTHER
/mod_base= OTHER
/note= "OTHER= The 3'-OH of the nucleotide at the 3' end
is protected by an amino group"
                                                                                                                                                                                                                                                                                                           This invention relates to a novel method which involves obtaining self/competition frequency tables (105,106) by counting each appearance number of partial base sequences maintained with respect to self/competition base sequence data (101,103). A probe candidate is derived based on extracted partial base sequence with respect to the obtained frequency tables. The method is useful for processing information of DNB probe design used in nucleic acid sequence analysis system. The method enables exact and reproducible DNA probe design, reliably. The present sequence is that of a DNA sequence which was used in the illustration of the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Stabilizing gene amplification reagents, involves utilizing a chimeric oligonucleotide primer for amplifying oligonucleotides and blocking the 3' terminal of the oligonucleotide, such that its expansion does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA amplification reagent stability-related PCR primer SegID8.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises a method of screening for candidate agents capable of altering the biological activity of a protein encoded by a nucleotide involved in hypoxia-related tumourigenesis. The method of the invention involves: contacting a test agent with a target cell expressing the nucleotide, and monitoring the activity of the expressed protein product; if the test agent modifies the activity of the expressed protein then this is a candidate agent. The method of the invention is useful for modifying hypoxia-induced gene regulation and for diagnosing, prognosing or treating tumours. The present DNA sequence represents a SAGE tag that was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying agents that alter biological activity of a polypeptide encoded by a polynucleotide involved in hypoxia-related tumorigenesis comprises contacting an agent with a target cell and monitoring activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

                                                                                         amplification reagent. The method involves utilizing a chimeric oligonucleotide primer for amplifying an oligonucleotide which is substantially complementary to the primer, where the ratio of Tm value of the primer and the oligonucleotide is 1.2-3.3 and the gene amplification reagent comprises the chimeric oligonucleotide primer, and blocking the occur. The method enables effective and improved stabilization of gene amplification reagents. The present sequence is that of a PCR primer which was used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to detecting the presence or absence of at least one target nucleic acid sequence in a sample (that further contains a nucleic acid molecule comprising a sequence corresponding to the target nucleic acid molecule comprises contacting the sample with at least one nucleic acid probe that is capable of selectively binding to a continuum of at least a part of the nucleic acid molecule corresponding to the target nucleic acid sequence and a part of the nucleic acid molecule adjacent to the corresponding sequence. Also included are a composition or a kit, used in the method above each comprising at least one nucleic acid probe that is capable of selectively binding to a continuum of at least a part of the nucleic acid molecule corresponding to the target nucleic acid sequence and a part of the nucleic acid molecule adjacent to the corresponding sequence. The method further comprises contacting the

ö to the nucleic acid molecule comprising a sequence corresponding to the target nucleic acid sequence prevents annealing of the extendable primer and/or extension of the primer (i.e. is a blocking probe). The continuum of at least a part of the nucleic acid molecule corresponding to the target nucleic acid sequence and a part of the nucleic acid molecule adjacent to the corresponding sequence comprises a transcription initiation site and its upstream sequence. The method, composition of kit are useful for detecting the presence or absence of at least one target nucleic acid sequence in a sample that further contains a nucleic acid molecule comprising a sequence corresponding to the target nucleic acid sequence is sequence in probe for a universal bacterial rRNA gene (based on prior art primers deposited in the Buropean ribosomal RNA database), used in the method of the invention. The invention relates to an isolated nucleic acid (NI) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADB13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or prognosing glaucoma in a sample obtained from a cell or bodily fluid (comprising detecting a polymorphism Human, optineurin, ds. ophthalmological, single nucleotide polymorphism; SNP; glaucoma; progressive ocular hypertensive disorder; glaucoma related disorder; motif; repeat element; regulatory region. New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related sample with a first extendable primer. Binding of the nucleic acid probe Gaps Optineurin promoter motif, repeat element or regulatory region #457. ; Score 7.4; DB 1; Length 10; Pred. They were eluted from the column by 27 percent ag. ammonia and heated to 55 deg C overnight. The soln, was diluted, fed to OPC and the elute washed three times with dil. aq. ammonia, dH2O and TFA. The nucleotides were eluted with 20 percent acetonitrile to give pure oligonicleotides. DNAs were extracted from cultures of human Mycobacterium tuberculosis, chicken M. avium, etc. and amplified using the above primers. The PCR prod. frpm all was a 236 bp fragment with a different restriction fragment pattern from each species. The method can detect the presence and type of various acid-fast bacteria (Mycobacteria) in a sample specimen, specifically and rapidly with high sensitivity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Detection of Mycobacteria genus microbe - by amplifying mixed soln. contg. The gene and its product may be used to detect tumours in blood, urine or sputum. Inhibitors of TCI are used to treat late stage cancers and for preventing tumour cell metastasis.                                                                                                                                                                                                                                                                                                                                                                                                Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine A1 receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and used to construct antisense oligonucleotides containing a phosphorothicate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or prevent conditions associated with bronchoconstriction and/or lung allows.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                  Treating respiratory disease with antisense sequences directed against adenosine or bradyknin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

Sequences AAV46501-V47446 are anti-sense oligonucleotides that target the human adenosine A1 receptor, the design of which required the secondary structure of this targets mRNA. The adenosine receptor mRNA secondary structure was both analysed and use to construct antisense oligonucleotides containing a phosphorothioate backbone. Once the antisense molecules are created they can be used to target their predetermined target, thus causing the gene product to decrease. The antisense oligonucleotides were targeted to specific mRNA regions containing either a junction between the intron and exon, or where they may overlap the initiation codon. The receptor is a member of the G-protein coupled family of cell surface receptors that have 7-transmembrane segments. These oligonucleotides can be used to treat or provent conditions associated with bronchoconstriction and/or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Treating respiratory disease with antisense sequences directed against adenosine or bradykinin receptors - with localised delivery to the respiratory system, suitable for long term treatment of asthma, adult respiratory distress syndrome etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         inflammation in humans or other animals e.g. asthma, pulmonary disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Secondary structure; mRNA; phosphorothioate backbone; G-protein; bronchoconstriction; lung inflammation; asthma; pulmonary disease; allergy; emphysema; cystic fibrosis; ss.
